RE: Goodfellow Federal Complex – St. Louis, MO  
Building #102D (MO0604AF) – Background Asbestos Air Monitoring  
Project # 92084.04

Dear Mr. Hartshorn:

On November 20, 2012, Ms. Patricia Garcia of OCCU-TEC, conducted background asbestos air monitoring services at the Goodfellow Federal Complex, Building 102D, located at 4300 Goodfellow Boulevard in St. Louis, Missouri. A recently completed asbestos inspection had identified asbestos containing floor tiles, pipe insulation, and drywall in “poor” condition at several locations. OCCU-TEC performed asbestos background air monitoring to ensure airborne asbestos had not migrated to other areas of the building. For this reason, transmission electron microscopy (TEM) background air samples were run in various areas of the building.

OCCU-TEC collected six TEM background air samples throughout the building. The samples were shipped via UPS to Bureau Veritas – North America (BV) in Kennesaw, Georgia for independent laboratory analysis.

TEM analysis procedures are specified in the National Institute of Occupational Safety and Health, Protocol 7402. TEM samples were collected on 25 millimeter, 0.45-micron pore size mixed cellulose ester membrane filters. TEM analysis is able to distinguish between asbestos fibers and non-asbestos fibers and records actual levels of airborne asbestos fibers. TEM can also distinguish the different types of airborne asbestos fibers.

Laboratory TEM air monitoring results indicate no asbestos structures were detected. Sampling was in accordance with EPA CFR Part 763 Appendix A to Subpart E. Air monitoring analysis sheets and laboratory analysis sheets are attached.

Respectfully,

Jeff T. Smith  
Senior Project Manager

Bureau Veritas Work Order No. A1211211
Reference: 92084.04 Building 102 D

Dear Jeff Smith:

Bureau Veritas North America, Inc. received 6 samples on November 27, 2012 for the analyses presented in the following report.

The results apply only to the samples analyzed in this project. Please note that any unused portion of the samples will be discarded after a sixty-day holding period, unless you have requested otherwise.

This material is confidential and is intended solely for the person to whom it is addressed. If this is received in error, please contact the number provided below.

We appreciate the opportunity to assist you. If you have any questions concerning the report, please contact the analyst whose name appears on the report or myself at (770) 499-7701.

Sincerely,

Kuntal Parikh
Senior Microscopist
Electronic signature authorized through password protection
ANALYTICAL METHOD FOR AIRBORNE ASBESTOS FIBERS USING TRANSMISSION ELECTRON MICROSCOPY (TEM) BY THE AHERA METHOD

The results of this report relate only to the samples listed in the body of this report.

Unless otherwise noted below, the following statements apply: 1) all samples were received in acceptable condition, 2) all quality control results associated with this sample set were within acceptable limits and/or do not adversely affect the reported results and 3) the industrial hygiene results have not been blank corrected.

Upon receipt in the laboratory, filters are transferred to a glass slide with a drop of dimethyl formamide/acetic acid clearing solution. After clearing, samples are partially ashed in a plasma asher. The filters are then carbon coated in a vacuum evaporator. Portions of the cleared/ashed/coated filters are excised and placed on 200-mesh copper TEM grids in a wick-type solutional washer containing 100% acetone.

Two grids are placed consecutively in the TEM for examination. An equal number of openings are examined on each grid at 15,000X magnification. Asbestos structures containing fibers which meet a >5:1 length:width aspect ratio and a minimum length of 0.5 micrometers are identified using morphology, selected area electron diffraction, and energy-dispersive x-ray spectroscopy. Fibers are classified by structure type, are sized (length and width), and are identified as chrysotile, amphibole, ambiguous, or non-asbestos. Results are reported as total asbestos structures per square millimeter of filter and asbestos structures per cubic centimeter of air (asbestos structures/cc). The Kennesaw, Georgia laboratory is accredited by NVLAP –Lab Code 101125-0.

For clearance of a work area in schools (k-12) the requirement is that the average of the results of the five inside samples is <70 str/mm2 assuming an analytical sensitivity of <0.005 structures/cubic centimeter.

The test report shall not be reproduced, except in full, without written approval of the laboratory. In addition, the report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.

*Magnification = Calibrated screen magnification at 15,000X. For ISO Method 10312 the calibrated screen magnification is at 20,000X

Analyst(s) Name/Date: (b) (6) 12/4/2012
**Request for Laboratory Analytical Services**

**Bureau Veritas North America, Inc.**

**Report results to:** Jeff Smith  
**Client Project Number:** 92084.04  
**Send invoice to:**  
**Name:** David Hartshorn  
**Company:** GSA Heartland  
**Address:** 1500 E. Bannister Road  
**City, State, Zip:** Kansas City, MO 64197  
**Name:** David Hartshorn  
**Company:** GSA Heartland  
**Address:** 1500 E. Bannister Road  
**City, State, Zip:** Kansas City, MO 64197

**Special instructions and/or specific regulatory requirements:**
- Asbestos Air Testing Services - Building: 102

**Soil samples only: Which state are these from?**

**Water samples are:**
- Drinking water
- Groundwater
- Wastewater
