

INTRODUCTION TO DECEMBER 2021

AIR SAMPLING REPORTS

The following reports are from a sampling event from November 29 through December 8, 2021, where air samples were collected at representative interior locations throughout the Goodfellow Federal Center. A total of 110 air samples, plus 15 blanks, were collected from within 13 buildings. Samples were analyzed for seven target metals: arsenic, barium, cadmium, chromium, lead, selenium, and silver. The testing was part of GSA's continual check for airborne levels of heavy metals by taking air samples inside tenant spaces at least twice a year.

No detectable levels of arsenic, barium, cadmium, chromium, lead, selenium, or silver were found in any air sample or blank. No further action is required at this time.

The Points of Contact for each tenant agency is being notified of the results for the building they occupy. If you have any questions concerning these data, please email r6environmental@gsa.gov and GSA will provide responses from the appropriate experts.
