# Help Select your Facility's Submetering System

Submetering energy consumption of individual spaces or pieces of equipment can improve tenant billing practices and optimize building operations through fault detection and diagnostics (FDD) and the identification of energy conservation measures (ECMs). Submetering can also aid in meeting policy goals and reporting requirements, such as for renewable energy generation.

	ELECTRICAL			GAS/WATER
	GPG-041 **Full-Panel**	GPG-042 **Wireless Current Transformers (CTs)**	GPG-046 **Single-Circuit**	GPG-051 **Non-Invasive Gas or Water**
	Monitors up to 42 circuits per panel; includes a bridge and CTs powered by voltage taps. Requires revenue-grade CTs for 2% accuracy. Ideal for tracking overtime utilities or multiple high-power devices.	Standard CTs clip onto electrical wires, powered by the current. The bridge collects data from up to 250 CTs, accurately tracking load profiles to identify equipment faults. 7% average accuracy.	Monitors single or 3-phase circuits, integrating a meter, gateway, and non-proprietary split-core CTs. Best for devices or end uses with high power consumption such as chillers or data centers.	Attaches a probe to the side of a gas or water meter. Collects real-time data and enables anomaly detection and insight into off-hour usage and gas leaks. *GPG did not evaluate water*.

Fault Detection and Diagnostics	✓	✓	✓	✓
Energy Tracking	✓	✓	✓	✓
ECM Measurement & Verification*	✓		✓	✓
Analytics/ Subscription	Dashboard with annual subscription. Requires FedRAMP authorization.	No meter or annual subscription. Download data via API for integration into local systems.	Optional analytics subscription or download data via API for integration into local systems.	No annual subscription. Integrates into the Building Automation System.

*Assumes revenue-grade CTs with voltage tap   **Real-time whole building data supports calculation of overtime utilities

DECISION FLOWCHART FOR ELECTRICAL SUBMETERING

Required accuracy level and number of circuits being monitored influence the selection process

Do you require accurate power measurement? (+/- 2% error)

NO → Are you measuring more than 5 loads in a single panel?[1]
- NO → Wireless CT
- YES → Full-Panel[2] with Standard CT

YES → Are you measuring more than 5 loads in a single panel?[1]
- NO → Single-Circuit with Revenue CT
- YES → Full-Panel[2] with Revenue CT

[1] General guidelines based on space available in the panel and set-up costs [2] Full-Panel requires an annual subscription and FedRAMP authorization   [1] Standard CTs have <10% measurement error
